

Parkers introduce new waterproofing systems

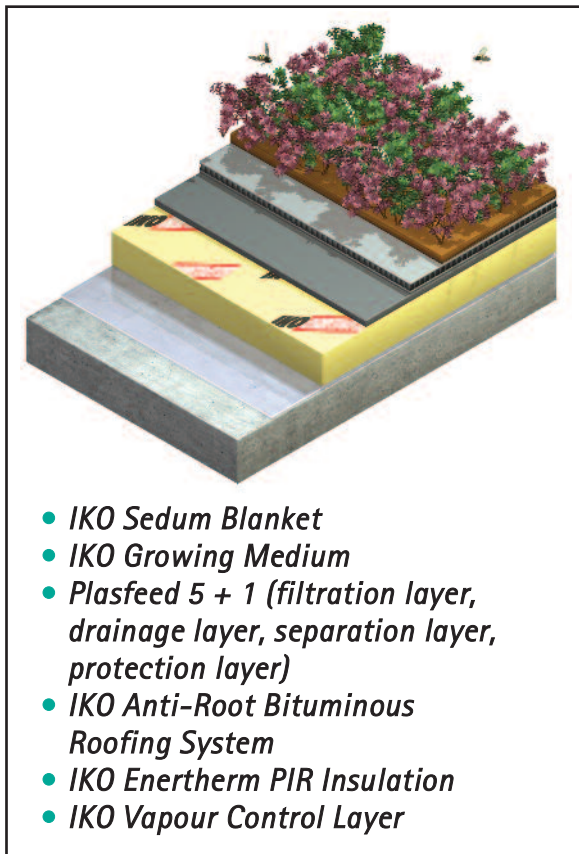

IKOgreen ROOFING SOLUTIONS

Selecting a waterproofing manufacturer and roofing system you can trust are essential to give long term, guaranteed performance. Parkers now supply IKOgreen roofing systems which offer ideal solutions for all waterproofing requirements.

IKO has designed and installed waterproofing systems for over 100 years, building a reputation on close working relationships with specifiers, contractors and clients in the public/private sectors, on extensive new build and refurbishment projects.

The company offers the most comprehensive range of selected waterproofing systems compatible with green roof finishes. Ensuring that exactly the right product is specified for the right project, no other manufacturer can provide such a diverse product offer.

Extensive green roofs

These are constructed using low maintenance planting, without the need for specific irrigation. Sedums (succulents) and indigenous herbs and grasses provide excellent cover and protection to the waterproofing system.

They do not provide usable space or a surface that can be trafficked, but add instantly to the aesthetics, improve the local air quality and help to control rainwater run-off into surface water drainage systems. In addition, a correctly designed system upgrades the acoustic and thermal performance of roof finishes.
